

Liquid Actuated Lighting Liquid Container

Abstract of the Disclosure

A liquid actuated lighting liquid container, comprising a transparent cup body and a cup base. The bottom portion of the transparent cup body has two electrical terminals and the cup base extends from the bottom portion of the transparent cup body. 5 The cup base comprises a circuit board, which further comprise a battery group, an illuminator, a low-level triggered circuit and a receiving socket. When a substantial amount of liquid is filled into the transparent cup body, a small current is conducted through the two electrical terminals, causing the low-level triggered circuit to produce a 10 larger current, which in turn causes the lighting up of the illuminator.
